

StealthAUDIT Action Modules

ABOUT STEALTHbits

STEALTHbits Technologies, Inc. provides a rich set of solutions to help manage your Microsoft infrastructure and beyond. As an industry leader in Auditing, Reporting, and Compliance software, solutions from STEALTHbits increase efficiencies, reduce downtime, and optimize the performance of your systems and applications to provide instant value and the quickest return on investment.

StealthAUDIT

StealthAUDIT is a lightweight, high speed and agent less tool. Using Data Collectors, information is returned on nearly every attribute with respect to Windows servers, workstations, Active Directory, Exchange, and more.

To ensure maximum flexibility, results are stored in Microsoft SQL Server and a built-in report writing engine enables the information to be delivered in a variety of formats; email, published, Excel, or XML.

Instant alerting is provided by tracking critical thresholds via the change and conformance module, and analysis will provide email notification any time such changes have taken place.

Rich historical data collection endows our customers with powerful trending and statistical capabilities.

StealthAUDIT comes packaged with pre-built solutions for Exchange, Active Directory, Public Folders, Inventory Management, Compliance, Patch Validation, BlackBerry, and much more!

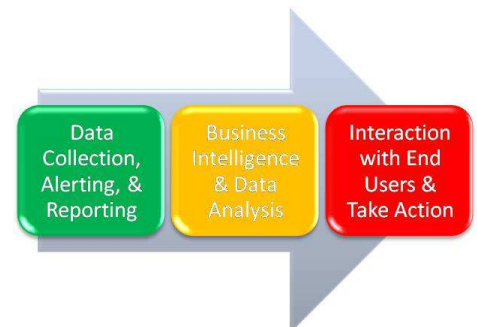

It's time to take ACTION!

In today's fast paced and demanding world of Information Technology, IT administrators need to keep pace by not only auditing their environment, but assessing how to respond to the mountain of data that is at their fingertips and take targeted actions to keep their environments in check.

StealthAUDIT supports multiple snap-in "Action Modules" providing the functionality necessary to taking administrative action on the data collected, interact with end-users in the decision making process, and make changes to remote systems right from StealthAUDIT's central console. It is through the Action Modules that the StealthAUDIT engine is able to effect change on remote hosts and help maintain order in your environment.

StealthAUDIT helps administrators not only collect large amounts of data from their IT environments quickly, but by leveraging our built-in business intelligence and Data Analysis modules, administrators can reduce the amount of interpretation needed before performing actions against the data. Turning data into information faster puts StealthAUDIT users in a position to take action sooner!

Available Action Modules

The following Action Modules are currently available:

- **Active Directory**
- **Exchange Mailbox**
- **Exchange Public Folder**
- **File System**
- **Registry**
- **SendMail**
- **Survey**

StealthAUDIT's Action Module Framework:

StealthAUDIT helps administrators not only collect large amounts of data from their environments, but by leveraging our built-in business intelligence and Data Analysis modules, administrators can reduce the amount of interpretation needed to take action against the data. Turning data into information faster provides the ability to take action sooner, all with a single solution.

ACTION MODULES

- Send Mail
- Survey
- Public Folder
- Mailbox
- Active Directory
- File
- Registry
- And more to come!

SendMail Action Module

The SendMail Action Module provides StealthAUDIT Administrators with the ability to email customized messages to end users and system administrators. This simple (yet powerful) module eliminates the time wasted cutting and pasting audit data into separate, manually created email messages to each one of your target audiences.

Automate your efforts with an easy to use Microsoft Word style editor to create your email message. Drag and drop images such as corporate logos or customized pictures, in addition to dynamically inserting audit data associated with your target audience in one message, rather than SPAMing your own users with multiple messages.

Email address capabilities include using: Active Directory Distinguished Names, Exchange Mailboxes, SMTP Addresses, Windows Security Identifiers, or Windows User IDs.

Whether you are putting together programs to communicate with your Public Folder owners about clean up initiatives or reaching out to workstation owners to inform them that they have unauthorized software installed that is in violation of your corporate policies, this Action Module will help you streamline the effort with a polished and professional look, while still maintaining a personal touch!

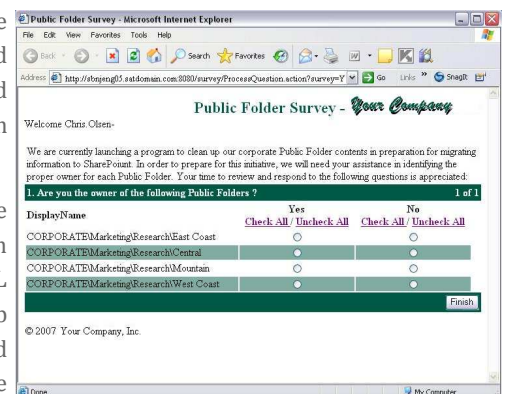

Survey Action Module

The Survey Action Module extends the capabilities of the SendMail Action Module by including an embedded website link within your message to provide targeted end users and administrators with the path to a survey form created by StealthAUDIT.

Using the same Microsoft Word style interface within the Survey Action Module, you can quickly create custom templates with descriptive messages and advanced HTML formatting without needing experience in web development. Adding corporate color schemes is easy and adding customized pictures or corporate logos is a simple right-click insert!

Dynamically, include any auditing information and solicit input and feedback for data that can **only** be addressed by the users themselves!

Ask questions, obtain direction or clarification of audit data, or even collect approval for automated central remediation or changes from your target audience. All responses from the respondents are tied to the audit information and is available for the same easy and custom reporting capabilities that are available within StealthAUDIT.

Customer Profile

Environment

- 50,000 Public Folders

“After only three weeks of using StealthAUDIT in our production environment, we were able to retire over 5,000 Public Folders and reclaim over 50Gb of storage space.”

- Fortune 50 Financial

Exchange Mailbox Action Module

The Mailbox Action Module provides the ability to automate the process of removing stale content from an Exchange Mailbox. Options include:

- Move to Folder Dumpster or Deleted Items
- Permanently Delete
- Delete Attachments (and replace with text)
- Delete Body Text (and replace with text)

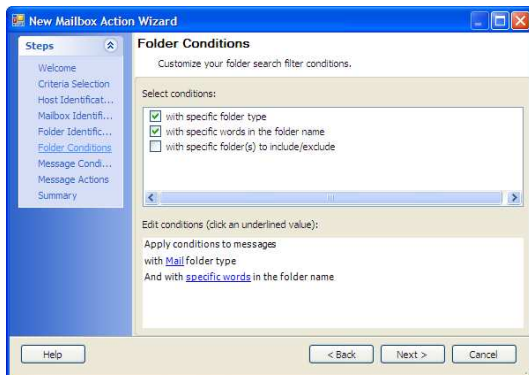

Applying bulk operations such as the deletion of content reduces the resources required to complete a clean-up initiative, in addition to reducing storage and backup costs associated with maintaining stale data in the mail store.

Couple the Survey Action Module with the Mailbox Action Module to interact with users as part of your clean-up initiative, receiving and recording responses from Mailbox Owners for authorization to remove their content, leaving a clean audit trail in place as the basis for your deletion actions.

Granular filter conditions allow you to “scope down” the folders and contents that are used in the action based on Folder Location, Name, and Type. In addition, counters such as.....

- Item Message Class
- Creation/Received/Occurrence Date
- Recipient/Sender Address
- Keywords in the message Header/Subject/Body
- And, Attachment presence

can be leveraged to take highly targeted action against only certain types of content.

Exchange Public Folder Action Module

The Exchange Public Folder Action Module provides the ability to make changes to your Public Folder environment including:

- Rename
- Change Permissions
- Modify Custom Attributes
- Reduce Replicas
- Enforce Limits
- Delete

Leverage the power of this Action Modules to easily overwrite permissions on an entire branch of thousands of Public Folders, or be as targeted as you like. Remove an individual account from having permissions to specific Public Folders or remove old, stale Exchange 5.5 SID's that no longer exist! You can easily change access permissions to set Default and Anonymous roles with specific permissions to prevent unauthorized eyes from viewing content or prevent security issues with data exposure or even just make a folder non-visible.

Use custom attributes to store notes on whether the folder has been identified for archiving, deletion, or migration to another document storage platform. Use a second custom attribute to track dates and timelines for when you want to take the next incremental action against your Public Folder environment.

Set size warnings and limits on folders that are growing out of control. Add deletion settings or age limits to folders so that old items will get deleted on their own or so deleted items get emptied from the dumpster to free up space.

Shutting down or relocating a regional office? Use StealthAUDIT to quickly assess all of the folders on a server and add a replica to the central office. Once that operation is complete, circle back to remove the existing copies on the server that is being retired.

By renaming your Public Folders, let your users know if a business units' name changes or that a particular folder or branch is being archived, migrated, or retired.

System Requirements

Operating Systems

- Microsoft XP Professional
- Windows Vista (Business/Ultimate)
- Windows Server (2000+)

Platform

Pentium 4 class or greater

Memory and Disk Space

Minimum Requirements:

1Gb RAM minimum (2Gb recommended)

1Gb Available Disk minimum

100Mb Network Connection

Additional Software

MS SQL 2005+ (including SQL Express)

Adobe Flash

File System Action Module

The File System Action Module provides the ability to make changes to remote files systems including;

- File and Folder Attributes
- Permissions
- Copying, Deleting, Moving, or Renaming

Extending StealthAUDIT with this Action Module will allow you to quickly identify and delete malicious files from servers and workstations across your infrastructure to control impact before Anti-Virus vendors have the right signature for you.

Planning to launch or expand your corporate archiving solution? Use the power of StealthAUDIT to identify sensitive files or personal PST archives and use the File System Action Modules to copy or move them to a central Archiving pick up point, push them from workstations to a users' home drive, or perhaps encrypt, hide, or mark them as read-only.

Perhaps you are gearing up for the new operating system upgrade and compressing large unused files and folders would save or free up valuable storage space needed as part of that upgrade program.

Active Directory Action Module

The Active Directory Action Module provides the ability to make changes to your AD infrastructure; create/modify users, create/modify groups, and move/delete objects.

Use StealthAUDIT to provision/de-provision users fed from external Human Resource databases or import user lists from files. Find unused computers or users and disabled accounts, move to a temporary OU, or purge them from your directory.

The StealthAUDIT Action Modules are a great addition to your IT arsenal and extension of our product line. Whether you can leverage these Action Modules for operational duties or for streamlining downtime and changes during maintenance windows, we feel you'll gain back highly valuable and much needed time to use elsewhere!

Registry Action Module

The Registry Action Module provides the ability to make changes to remote system registries including;

- Change Permissions
- Create, Modify, or Delete Registry Keys and/or Values

Additionally, this Action Module allows an administrator to import a Registry file to make bulk Registry changes against remote systems.

Fine tune Registry settings to optimize system performance and validate those settings on hundreds of systems during your downtime window in the same amount of time it would take a team of people hours to configure and validate.

Use StealthAUDIT to discover systems where your Anti-Virus signatures are out of date and use the Registry Action Module to trigger the registry keys to kick off remote processes for downloading new signatures or even initiating a full system scan.

Maintain consistent and standard configuration across your global infrastructure by adding or correcting registry entries like logon warning messages, default background pictures, or even screen saver settings in minutes.
